Program 7 Symbol Table

Name	Type	Scope	Line
a	int	0	14

The first two programs complete Lex, Parse, and Semantic Analysis without any errors. Since there are no variables in either, after passing parse, there isn't any scope/type checking to do. The third program fails due to a parser error of an extra closing brace, so semantic analysis is skipped and the AST and symbol table are also skipped. The fourth program fails from lex because of the illegal symbol, so it also does not continue to complete parse or semantic analysis. The fifth program fails at semantic analysis because we are trying to set $a = b$, and a is of type int and b is of type string, it also throws warnings for the variables if they are unused or uninitialized. The sixth program fails at parse because after type, an id is expected and instead we got another type. The seventh program passes semantic analysis, lex, and parse, since there are no type errors or scope errors. It prints out the AST and symbol table for the program.

BOOLEAN TEST CASES (NON-VERBOSE MODE)

Input text:

```
{int i while(1!=(1==(1!=(1!=a)))){}}$  
  
{boolean s while(s!=(s==(s!=(1!=2)))){}}$  
  
{string a boolean b if (false == (b == (a != "string"))) {}}$  
  
{boolean b if(b==(b!=b)){}$  
  
{string s int i if(i==s){}}$  
  
{int a a = 1 + (3 != 3)}$  
  
{int a print(1 + (3 != 3))}$  
  
{int a a=1+3}$  
  
{print(("aa" != 1))}$  
  
{boolean a a = (true == (a != (true != true)))}$
```

Output:

Program 10 Symbol Table

Name	Type	Scope	Line
a	boolean	0	19

The first program fails semantic analysis for multiple errors. The variable "a" in (1 != a) is undeclared, also we are trying to compare BooleanExpressions to the integer "1", so it throws multiple errors for that. The second program passes, because (1!=2) will produce a boolVal (false) and then we are comparing that to the boolean variable "s" over and over, so there are no type errors. The third and fourth programs also

pass, because all variables are defined before they are used, and there are no type mismatch errors. The fifth program fails because we are trying to compare string `s` to int `i`; two variables of different types. The sixth and seventh programs fail because we are trying to add `1 + BooleanExpression` in both a print statement and an assign statement. The eighth program passes since `a` is an int and we are setting it equal to an `intOp`. The ninth program fails due to type mismatch comparing a string to an int within a print statement. The tenth program is an extreme boolean expression that passes since all variables used in the expression are of type boolean.

SCOPE TEST CASES (NON-VERBOSE MODE)

Input text:

```
{boolean a {{{{{{print(1+1)}}}}}}}$
```

```
{string a a=1}$
```

```
{boolean b b = "true"}$
```

```
{int a {boolean h {a =4} h = true}}$
```

```

Program 4 Symbol Table

Name	Type	Scope	Line
a	int	0	7
h	boolean	1	7

The first program passes, but just throws a warning for variable a saying that it is declared but never initialized or used. The second program fails because we are trying to assign string a a value of '1'. Program 3 also fails because we are trying to assign a boolean a string value. The fourth program passes since both a and h are declared before they are used.

SUPER LONG TEST CASE (NON-VERBOSE MODE)

Input text:

```

{
    int a
    a = 0
    string z
    z = "bond"
    while (a != 9) {
        if (a != 5) {
            print("bond")
        }
    }
}

```

```

    }
    {
        a = 1 + a
        string b
        b = "james bond"
        print(b)
    }
}
{}
boolean c
c = true
boolean d
d = (true == (true == false))
d = (a == b)
d = (1 == a)
d = (1 != 1)
d = ("string" == 1)
d = (a != "string")
d = ("string" != "string")
if (d == true) {
    int c
    c = 1 + d
    if (c == 1) {
        print("ugh")
    }
}
while ("string" == a) {

Program 1 Semantic Analysis produced 9 error(s) and 2 warning(s).

AST for program 1: Skipped due to SEMANTIC ANALYSIS error(s)

Symbol Table for program 1: Skipped due to SEMANTIC ANALYSIS error(s)

This test case fails semantic analysis for many different reasons. The first is because variable "b" is used outside of its scope in the expression `d = (a == b)`. Next, there are some type comparison errors trying to compare "string" to 1 and "string" to variable a (type int). Then, we are trying to add `1+d` (d is of type boolean). Then, again int a is compared to "string" and 1 is compared to the boolVal true. Finally, we try to add `1 + "string"` which is invalid, so it throws another error.
